

## Distribution and measurement of electrical power

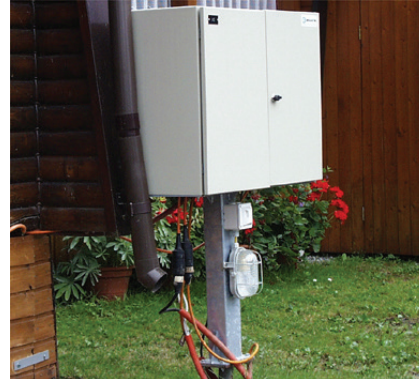

Kunde: Marina Rheinhof GmbH, 9423 Altenrhein

### Task

The distribution and the measurement of the consumption on camping-sites is often a problem. The places are more and more rent permanently. However who likes to pay the power consumption of his neighbour? For this reason we have looked for an acceptable solution for:

- an optimal distribution concept
- a simple accounting of the used power
- a clear separation of each consumer as well as a weather-proof, long-lasting installation system

- power distribution individually equipped according to the wishes of our customers
- installed into a solid, lockable, stainless sheet steel box,
- custom-made steel columns and mounting systems
- discrete colouring
- compact construction
  
- the box can be closed also when the plugs are inserted
- execution with motion detector and integrated light to illuminate the street
- brush protection at the cable end to prevent insects and other foreign objects from penetration
  
- power-socket, FI protection, fault-current and counter for each consumer!

Utilisation of special plug connections with padlock

- no unauthorized power consumption
- clear splitting of the plug possibilities
- simple connector system
